## Let's Go Camping With Joo

The website is meant to give people simple, useful info on how to get ready for a camping trip: what to wear and what to bring. At the end, there will also be a fun interactive section where users can decorate their own campsite however they like.

The first page will share practical camping tips in a clean, layered layout using HTML and CSS. The grid layout will include the site title, a navigation bar with three or four menu items, the main content area, and a footer with sources.

On the second page, users will get to dress a character in warm outdoor clothing. This will be built with p5.js so everything will be interactive and visually dynamic.

The third page will show a camper van heading out on the road, animated with CSS. This serves as a small transition moment from preparing for the trip to actually starting the adventure.

The final page will feature a forest background where users can design and decorate their own camping spot. The character will be able to move around the scene using a mix of JavaScript and p5.js to make everything interactive.

While building the site, I will also be editing a number of images in Photoshop to give them transparent backgrounds. This is important for layering items cleanly, especially when dressing the character or arranging objects in the campsite. It will probably be one of the more time consuming steps since each image needs careful preparation.

Overall, the website will use a nature inspired color palette with greens, starlight tones, blues, and browns to match the outdoor theme and keep everything visually cohesive.
